

# **Trends in Marriage Rates**

The overall marriage rate has been declining in the last two decades.

### **Headline/Trends**

The overall marriage rate has been declining in the last two decades, with rates falling from 9.9 in 1987 to 6.3 in 2009.1

The period following the Second World War marked an era of high marriage rates. This era between the 1950s and early 1960s was marked by improved economic conditions, high fertility, and a social climate which encouraged an earlier onset of adult transitions. Since the 1960s, marriage rates have declined while divorce rates have increased.<sup>2</sup> The subsequent decline of marriage has been influenced by a number of social and economic factors.<sup>3</sup>

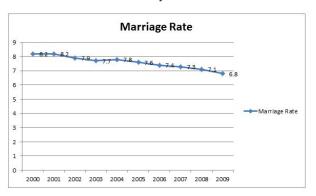

## **Background**

Even though this indicator shows a decline in the marriage rates of Americans over the past two decades, weddings are still frequent occurrences, with slightly less than 2.1 million marriages occurring in 2009.<sup>4</sup> Many factors can impact marriage rates, such as an increase in the number of adults who choose to cohabit rather than marry and the trend of delaying marriage to later ages.<sup>5,6</sup>

## **Differences by Subgroup**

Information about subgroups was not available in the data sets used for this analysis.

#### **Definition**

Marriage rates are measured as the number of people married in a given year per 1,000 people in the population and are based on state counts from registration offices. Note that this rate is calculated across all people in the population, of all ages, both married and unmarried, and thus this represents only a general measure of trends in marriage.
